

Problem

Our idea solves the problem of unreliable and missing real-time accessibility data for pedestrian pathways, which significantly restricts mobility for individuals with disabilities. This lack of data prevents them from fully participating in daily activities, work, and social life.

According to the [Eurostat](#), approximately 23.1% of Greek citizens have disabilities, while over 45% face mobility difficulties. Many of them struggle daily with access to essential infrastructures such as stores, public services and transportation.

This issue leads to missed business opportunities, legal compliance risks and the exclusion of a significant amount of people who struggle to access public spaces and services.

Customer

The problem affects people with mobility challenges, including individuals with disabilities, elderly citizens, parents with strollers and individuals with temporary injuries. It also impacts businesses and local governments who need to comply with accessibility regulations and improve inclusivity.

They care enough about the problem to want to fix it because individuals with mobility issues need real time accessibility data to navigate cities with independence and confidence. Without it, they face social isolation, economic disadvantages and daily inconveniences.

Businesses risk losing customers and revenue, if their locations are perceived as inaccessible. They also face legal and reputational risks due to non compliances with the law.

Local governments must improve mobility infrastructure, comply with regulations and minimize citizen complaints to create more accessible and inclusive cities.

Solution

Our idea solves the problem by providing an innovative, real time, accurate accessibility mapping platform that allows individuals with mobility challenges to easily navigate urban areas.

It gives digital guidance by offering capabilities such as indicating accessibility friendly infrastructures and easily traversed pathways. The application generates reports for local governments in order to keep them updated about accessibility issues in their area of jurisdiction.

Each user can post about incidents (roadworks, illegally parked vehicles, etc.) that make pathways inaccessible and thus updating the map in real time.

An incident about an illegally parked vehicle can also be shared with the traffic police by uploading a picture and a location pin.
